

## Benefiting Staff and Patients Alike

With over 50 years experience, Ascom is a leader in the provision of wireless based speech and data systems for the hospital environment. These include paging, DECT, IP-DECT and VoWifi platforms, providing voice, data & alarm functions combined in a single robust handset.

The new IP DECT application is able to cover many diverse operational requirements. For example large sites containing any number of remote general purpose and high security buildings: Mission critical functions including Lone Worker Protection both at ward level, and non-clinical personnel working in the grounds; interfacing with existing hard wired alarms both in clinical environments and areas with specific safety aspects; instantaneous cardiac and violence alarm messaging direct to emergency response teams, including incident location to ensure a rapid response. Handset functionality includes swappable SIM cards; integration with the existing PBX; hands free speech and alphanumeric text.

At the Show Ascom will be launching '**aTouch**'; a new PC based instant messaging software that enables rapid and accurate dispersal of alerts and alarms from a central control to individuals or predetermined task groups.

Overall Ascom systems provide a positive benefit by improving risk management and on-site communications.
